

Final Report on Front-End Web UI Frameworks and Tools

This was utmost experience to take this course of front-end web frameworks and tools. I was the person who always want to learn web development but don't where to find the better way to start. As I continue to search online I got chance of founding this opportunity. And I did not hesitate to take a chance and start to learn this course.

As I continue to work on this course I started to get more knowledge and skills. Which was my primary purpose to improve my skills and knowledge.

The first assignment and exercises, was very interesting where I got skills of using bootstrap class and organizing my work and experiencing Git command that was in the week one and final assignment which was the first assignment was to put bootstrap classes in aboutus.html page.

The second week was awesome experience to have, it was all about using bootstrap components such button, forms and badge on the index page. As it was my first to work on project, it was good to work on this like what I did in this week.

The third week was week of bootstrap JavaScript components, and was week of designing models and updating forms of reservation table and adding checkbox for smoking and non-smoking.

Last week on this course was to take skills on popular frameworks, such as jQuery, sass, and less. It was my first time to use sass and less, how to use nested and function and variables in sass and less which is not available in CSS.

Let take this time and thank for my instructor on this course and courser foundation as well as common wealth for giving me this scholarship.
